

ABDULLAH et al.: Soil Macroinsect Diversity and Soil Properties in a High Conservation Value Area of Oil Palm Plantation, Pulau Carey, Selangor, Malaysia

APPENDIX I. Individual-based rarefaction and extrapolation curves of soil macroinsect richness in High Conservation Value (HCV) and Oil Palm Plantation (OPP) areas, excluding Formicidae to assess richness patterns independent of ant dominance. Curves are standardized by sampling effort for comparable expected richness between habitats. The solid lines represent rarefaction, dashed lines represent extrapolation and shaded areas indicate confidence intervals at 95%.
