

ABDULLAH et al.: Soil Macroinsect Diversity and Soil Properties in a High Conservation Value Area of Oil Palm Plantation, Pulau Carey, Selangor, Malaysia

APPENDIX II. Two-way cluster dendrogram of soil macroinsect assemblages in High Conservation Value (HCV) and oil palm plantation (OPP) areas based on Sorensen dissimilarity of family level presence-absence data. The lack of separation between HCV and OPP suggests that variation between habitats is caused by difference in relative abundance and assemblage structure rather than by the presence of habitat-exclusive taxa.
