Abstract

A survey on birds of the Imbak Canyon Study Centre was conducted from 16th to 26th August 2017, in every direction along the roads, forest trails through the understorey, i.e. whenever fine weather permitted. A total of 92 species of birds from 33 families were recorded. A total of 27 species are Near Threatened, one species is Vulnerable (Blue-headed Pitta), one species is not recorded (White-crowned Shama) and one species are Critically Endangered (Helmeted Hornbill). The present survey contributed nine new records to the area, updating the compiled list to 252 species, from the previous 243 species. The nine new records are Lesser Cuckoo Shrike, Red-bearded Bee-eater, Dark-sided Flycatcher, Yellow-vented Flowerpecker, Van Hasselt's Sunbird, Temminck's Sunbird, Yellow-bellied Prinia, Bold-striped Tit Babbler, and White-necked Babbler. All new records of the area are in the Least Concern category except the White-necked Babbler, which is Near Threatened.

Keywords: avian, Borneo, rainforest, Malaysia, biodiversity, vertebrate

Introduction

Management of protected areas for the conservation of species assemblages is a challenge due to the mounting loss of natural habitats and biodiversity. Although it is known that most vertebrate species need a large foraging area to survive and that they cannot be conserved only within a few protected areas (González-Maya et al., 2015), focusing conservation efforts to a few selected sites that do not have much human pressure is still much needed.

Imbak Canyon Conservation Area is largely free of human settlements and is covered with a continuous primary rain forest. The nearest village is Kg. Langga (4 km away), while the nearest town is Telupid, approximately 94 km from the Imbak Canyon Study Centre (ICSC). There are a number of satellite camps in

ICCA, with facilities to accommodate the most basic needs of a small group of researchers. A scientific expedition was conducted at Batu Timbang Camp (BTC), which is approximately 10 km from ICSC. This camp is the nearest to the Batu Timbang Forest Reserve, under the jurisdiction of the Sabah Forestry Department. BTC has never been surveyed before, and thus, this expedition was to obtain representative samples of biodiversity, and to support planning for long-term conservation. Hot spots of species richness, rarity or endemism may be identified and used to define priority areas (Reid, 1998).

Birds are often used as indicator taxa because they are well known, the most conspicuous of all fauna, easy to census, charismatic and they have been found to be among the best surrogate taxa for biodiversity in conservation area planning (Reyers et al., 1999). The total bird species in Malaysia is 785, of which 51 species are endemic (47 species are endemic to Sabah and Sarawak). A total of 48 species, unfortunately, are globally threatened species (35 in Peninsular Malaysia and 30 species in Sabah and Sarawak). This report covers the presence of birds at the ICSC, a previously undocumented area.

Method

Study Area

The interior of ICCA (approximately 30,000 ha) is covered with a continuous rain forest, sparsely inhabited, almost only along its borders. The main relief is a succession of hills and streams between 250 and 333 m, with the highest peak at 1,120 m a.s.l. Temperature in the lowland varies between 25°C to 35°C. The wet season is between November and April and the dry season is from May to October.

Study sites

The study sites comprise the ICSC, which include the forest trails after crossing the Ara hanging bridge and Kapur hanging bridge; viewpoints at ICSC, verandah of the dining hall, and roads towards Imbak Falls.

Census technique

At the ICSC, daily surveys were conducted from 16 to 26th August 2017, in every direction along the roads, forest trails through the understorey, mainly within a 500m radius, i.e. whenever fine weather permitted. All locally existing forest trails, as well as clearings associated with rivers were covered. Speed of walking was very slow (<1 km/h), with frequent stops, recording and photographing every bird, seen or heard, that was perched within 25 m of the walking line at

any height. Only species records were used, the number of individuals involved at each record was most often difficult to assess. All diurnal (Falconiforms) and nocturnal (Strigiforms), migrants, occasional, vagrant or resident species were included in the surveys. Photos were taken with two set-ups: 1) Nikon D500 with a AF-S Nikkor 300mm f/4E PF ED VR lens and AF-S teleconverter TC-14E III and 2) Nikon D500 with a AF-S Nikkor 200-500mm f/5.6 E ED VR lens.

Results and Discussion

A total of 92 species from 33 families were recorded during the expedition (Table 1). Timaliidae has the highest species richness, with 12 species, followed by Pycnonotidae (10 species) and Nectariniidae (8 species). The rest of the families range in species number between one and six species (Figure 1).

IUCN Red List of Threatened Species: **NE**=Not Evaluated, **DD**=Data Deficient, **LC**=Least Concern, **NT**=Near Threatened, **VU**=Vulnerable, **EN**=Endangered, **CR**=Critically Endangered, **EW**=Extinct in the Wild, **EX**=Extinct., F=Female, M=Male

The overall bird species richness is high, with a large proportion of species that are Least Concern in the conservation status of the IUCN Red List v. 3.1 (67% or 62 species). Approximately 33% of the total species recorded is under some pressure of threat (Figure 2). A total of 27 species are Near Threatened, one species is Vulnerable (Blue-headed Pitta), one species is Not Evaluated (White-crowned Shama) and one species is Critically Endangered (Helmeted Hornbill).

Figure 2. Percentages of bird species recorded during the 2017 expedition according to the conservation status of the IUCN Red Data List of Threatened Species.

Table 2 shows the compilation of bird data from the latest expedition and five previous surveys in ICCA (Yayasan Sabah 2014). The total species of birds documented by Yayasan Sabah (2014) (after some data clean-up, i.e. duplication) is 243 species (originally 245 species). The present survey contributed nine new records to the area, updating the compiled list to 252 species. The nine new records are Lesser Cuckoo Shrike, Red-bearded Bee-eater, Dark-sided Flycatcher, Yellow-vented Flowerpecker, Van Hasselt's Sunbird, Temminck's Sunbird, Yellow-bellied Prinia, Bold-striped Tit Babbler, and White-necked Babbler. All new records of the area are Least Concern except the White-necked Babbler, which is Near Threatened. It is important to note that since the last update by Yayasan Sabah (2014), the Short-tailed Babbler (*Trichastoma malaccensis*) has become Near Threatened from Least Concern (BirdLife

International, 2016) due to increased rate of forest loss owing partly to illegal logging and land conversion in the Sundaic lowlands. The Straw-headed Bulbul (*Pycnonotus zeylanicus*) has also since become Endangered from Vulnerable, due to illegal trading and forest loss. It has been reported that the average price for wild-caught bird is USD483 (A. Miller *in litt.* 2016). From the latest compiled data, 32% of the total of 252 are in some level of threat: two species are Critically Endangered, one species is Endangered (Straw-headed Bulbul), 71 species are Near Threatened, nine species are Vulnerable, and one species is Not Evaluated (White-crowned Shama). The rest of the species (170 species) are in the Least Concern category (Table 2).

ICCA and Maliau Basin Conservation Area (MBCA) are characterised as being lowland and montane rainforests, while Danum Valley Conservation Area (DVCA) as being largely montane (Yayasan Sabah 2014). The diverse range of natural vegetation communities and habitats (five types) defined for ICCA by Ong et al. (2000) shelter a high biodiversity with many endemic and threatened species, as well as potential new records of new species. The mosaic of different natural habitats, specific communities and patch sizes result in high diversity, population sizes and species composition of birds. Case in point is the bird surveys conducted during this expedition. Although sampling during the expedition was nine days, there were only three full days of good weather that actually permitted productive fieldwork that produced most of the bird species in the list of 92 in total. Many of the species were photographed as evidence of presence. These records and materials will be useful for Yayasan Sabah to manage the ICCA.

IUCN Red List of Treated Species: NE=Not Evaluated, DD=Data Deficient, LC=Least Concern, NT=Near Threatened, VU=Vulnerable, EN=Endangered, CR=Critically Endangered, EW=Extinct

Acknowledgements

Several people contributed to the species list, especially Daicus Bellabut, Mahathir Ratig and Eddie Ahmad. We would like to acknowledge Universiti Kebangsaan Malaysia; Dr. Yap Sau Wai, acting group manager Conservation and Environmental Management Division, Sabah Foundation; En. Hamzah Tangki, the manager of ICSC; and all the rangers of ICSC for their help and friendship during the expedition, especially Edward Asrul Alimin Sinon and Brandon Don. The expedition was sponsored by Petronas and Yayasan Sabah.
